

Aravin.S - Lab 8 - CPS 125 PART II

1. It is necessary to send the side to a function that accepts a numerical array because the side value is an integer. Only integers are able to be accepted by a numerical array. If this were another value (i.e char) this cannot be accepted because it would not be the right variable type that can be accepted by the numerical array.
2. You need a “\0” at the end of a string because this is necessary to terminate a string within a character array. This point \0 allows the computer to find the point where a string ends.
